Curious is a simple portfolio template for agencies, freelancer and for personal use.

Documentation for Personal and Freelancer template.

Consist of 6 pages -

index-freelancer3col.html index-freelancer4col.html casestudy-freelancer.html about-freelancer.html service-freelancer.html   contact-freelancer.html

Folders - 3
csspersonal folder - This folder contains your css stylesheet files.
jspersonal folder - This folder contains your javascript and jquery files.
Image folder - that carries all yours images i.e.
logo folder personalportfolio folder personalpic folder and companylogo.

To edit your webpage you need text-editor that edit yours website links or change font-color, font-size, background-color and etc, it can be done using notepad, sublime text, Microsoft Visual Studio or Adobe Dreamweaver. Best you can use is notepad, easy to edit and save your files after edit, if internal editing needed then only.

For index-freelancer3col.html and for other pages. Open them using notepad to edit internal codes. Now leave <head></head> section, it's for linking of external files and come down to <body> where you will find you menu, logo, and etc that live webpage consist of. Here you can edit your content.

And to replace images i.e. like for logo or for background or for portfolio images and for such more images, what you have to do is,
Go to image folder i.e. click on image folder, now select any folder inside from it, well let's start with logo folder.
Now click on logo folder and even copy your company logo which you already had and paste in logo folder, now check in your text editor this below code,

<!--logo-->
<img src="image/logo/curiousdark01.png">
image and logo in above code is folder name, curiousdark01.png is your file name.

So curiousdark01.png is my file name in my text editor, so now delete curiousdark01.png from logo folder and rename your   personal logo name as curiousdark01.png. Thus your logo get's changed.

Using this method you can change all images in your personal and freelancer website template.

Note -

Never use image of too big size or it will slow down your website loading speed. Great if there size are in kbs(kilobytes) instead of mbs(megabytes).

Now you can easily find text that you want to edit in your text editor, mostly text are placed in-between <h1><h2><h3><h4><p><span> tags. Edit and replace them by your company data.

Now to change color, or increase font-size or if some alignment issue then for that go to personalcss folder there you will find
 two files stylesheet.css and media.css and click on stylesheet.css.
 stylesheet.css consist of all codes that increases or decreases the size of an element and even decorates it.

For example :
```
      h1{
         font-family: 'Reem Kufi', sans-serif;
         font-size:16px;
         color : yellow;
      }
```

So in above codes,
font-family is font face for your text.
font-size is size of font which can be increased and decreased numerically.
color - changes font color i.e. text color.
Thus you can find many such properties in your stylesheet.css. Which you can edit if you want.
Changes that you make in media.css file can be seen on mobile device or on tablets.

Header and Footer : - We have two menu,
Menu - one for desktop, laptop and other screens,
MobileMenu - It's for tablet, mobile and other small screen devices.
You can see below code in all your 8 web pages when you open them in text-editor.

Menu

```
 <div id="header">
 <div class="logo"><a href="index-freelancer3col.html"><img src="image/logo/curiousdark01.png"></a></div>
 <div class="menu">
 <ul>
     <li><a>Work</a>
  <ul>
     <li><a href="index-freelancer3col.html">3 - Column</a></li>
     <li><a href="index-freelancer4col.html">4 - Column</a></li>
  </ul>
</li>
     <li><a href="about-freelancer.html">About</a></li>
     <li><a href="service-freelancer.html">Services</a></li>
     <li><a href="contact-freelancer.html">Contact</a></li>
     <li><a href="#">Buy Now</a></li>
 </ul>
 </div>
 </div>
```

Mobile Menu

```
<div id="mobileheader">
<div class="logo"><a href="index-freelancer3col.html"><img src="image/logo/curiousdark01.png"></a></div>
<div class="burgermenu">
<span></span>
<span></span>
<span></span>
</div>
</div>

<div id="mobilemenu">
<div class="cross"><i class="fa fa-times"></i></div>
<ul>
    <li><a>Work</a></li>
    <li><a href="index-freelancer3col.html">3 - Column</a></li>
    <li><a href="index-freelancer4col.html">4 - Column</a></li>
    <li><a href="about-freelancer.html">About</a></li>
    <li><a href="service-freelancer.html">Services</a></li>
    <li><a href="contact-freelancer.html">Contact</a></li>
    <li><a href="#">Buy Now</a></li>
</ul>
</div>
```

Well now changes i.e. text and links changes that you will make in above menu or mobile menu codes should always be same on remaining pages too. So makes changes on one page and copy, replace them. Thus your menu will same on all 6 pages.

After completing all your editing work, always save your home-page as index.html.

For any kind of issue or error you could contact us through Themeforest or through mail-id i.e. contact@creativetheme.tk, we will reply and solve your problem as soon as possible.
